INSTALLING DRUSH ON WINDOWS:

Windows support has improved, but is still lagging. For full functionality, consider using on Linux/Unix/OSX using Virtualbox or other virtual machine.

There is a Windows msi installer.

Whenever the documentation or the help text refers to 'drush [option] ' or something similar, 'drush' may need to be replaced by 'drush.bat'.

Additional Drush Windows installation documentation can be found at http://drupal.org/node/594744.
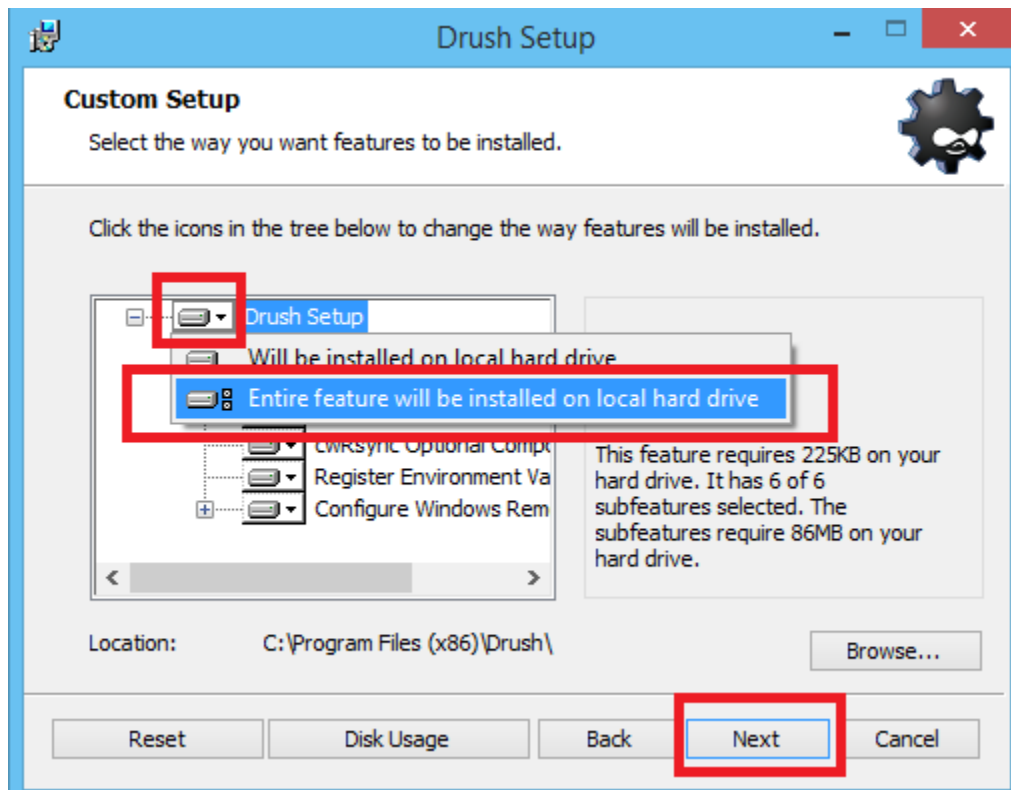

Most Drush commands will run in a Windows CMD shell or PowerShell, but the Git Bash shell provided by the 'Git for Windows' installation is the preferred shell in which to run Drush commands. For more information on "Git for Windows' visit http://msysgit.github.com/.

When creating aliases for Windows remote machines, pay particular attention to information presented in the example.aliases.drushrc.php file, especially when setting values for 'remote-host' and 'os', as these are very important when running Drush rsync and Drush sql-sync commands.
